                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named similarity but with EST similarity are named as 'unknown' proteins. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RNA;RepeatMasker.html). Regions of genomic sequence that are not annotated as genes but have predicted so trocation/qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Lin.X. and Kaul,S.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note="Vector: pBluescript II SK+; Site_1: ECORI; Site_2: XhOI; The cDNA library was constructed from mRNA isolated germinating shoots of the cultivar Williams. The seeds were allowed to germinate for 24 hours prior to being cold stressed for 2 days at 4C. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhOI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhOI digestion. The cDNA fragments were directionally cloned into the EcoRI-xhOI restriction site of the pBluescript vector. The ligated cDNA fragments were constructed into DHIOB host cells (GibcoBRL). This library Shoemaker."

/note="Vector: pBluescript SK-; Site_1: EcoRI; Site_2:
XhoI; cDNA was prepared from polyA+ enriched RNA from
roots harvested at 10 days post inoculation with
Phytophthora medicaginis. The cDNA was directionally
ligated into the Uni-ZAP XR vector from Stratagene and
packaged using Gigapack III Gold packaging extracts.
Plasmids containing cDNA inserts were excised from the
recombinant lambda-ZAP phage using Ex-Assist helper phage
and propagated in XLOLR cells. Note: EST may be of fungal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /dev_Stage="roots harvested at 10 days post inoculation with Phytophthora medicaginis"
/lab_host="E. coli strain XLOLR"
/note="vector: pBluescript SK-; Site_1: EcoRI; Site_2: XhoI; cDNA was prepared from polyA+ enriched RNA from roots harvested at 10 days post inoculation with Phytophthora medicaginis. The cDNA was directionally ligated into the Uni-ZAP XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-ZAP phage using Ex-Assist helper phage and propagated in XLOLR cells. Note: EST may be of fungal criqin."

//note="Vector: pBluescript SK; Site_1: EcoRI; Site_2: XhoI; cDNA was prepared from polyA+ enrisched RNA from roots harvested at 10, 17, 22, 31 and 38 days post-inoculation with Glomus versiforme. The cDNA was directionally ligated into the Unizap XR vector from stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propagated in XLOLR cells."

The shoot tips including any emerged leaves were harvested for mRNA isolation. The cDNA library was prepared using the Stratagene pBluescript II XR cDNA library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly (dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The CDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into XIIO-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John Erpelding." 92 9 72 t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       XhoI; Immature pods, ranging in age from 15 to 30 days after pollination, were collected from greenhouse-grown plants. At harvest, seeds were removed from pods and isolated pod walls were collected and immediately frozen in liquid nitrogen. Pod walls were pooled for mRNA extraction. cDNA was prepared from polya+ enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propogated in XLOLR cells."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents DNA encoding a novel spinach ribose-5-phosphate isomerase. The invention relates to a protein with ribose-5-phosphate isomerase activity, comprising at least 100 residues of a 289 residue spinach amino sequence, preferably residues 50-239. Novel phosphate isomerase inhibitors can be identified by incubating potential inhibitors with the enzyme and determining the ribose-5-phosphate isomerase activity. These inhibitors can be used as herbicidal agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1118 BP; 261 A; 264 C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes polynucleotides, such as complete cDNA sequences and/or sequences of genomic DNA encompassing complete genes, portions of genes, and/or intergenic regions, collectively referred to as sequence-determined DNA fragments (SDFs), from corn plants and untranslated regions (UTRs), or 3' termination sequences. They can be used for expressing a gene product and controlling expression of a starget gene, either as a promoter, a structural gene, an UTR or as a 3' termination sequence. They can be target gene, either as a promoter, a structural gene, an UTR or as a 3' termination sequence. They are also useful as tools for genetic clustering a group pf plants with a common trait. AAA78433 to AAA78630 polynucleotide sequences and polypeptides encoded by them given in the

The host cell (a microorganism, Corynebacterium or Brevibacterium, moss or algae or a plant cell) is useful for producing a fine chemical such as carbohydrates, cofactors and/or enzymes. The nucleic acid molecules are suitable for modifying a carbohydrate production system in a host, e.g., microorganisms and plants. They are also useful to identify those DNA sequences and enzymes in other species which are useful to modify the biosynthesis of starch, cell wall polysaccharides and sugars. The nucleic acid molecules may be utilised in the genetic engineering of Corynebacterium glutamicum and the related Brevibacterium species and Acetobacter xylinum and Chlorella to
                                                                                                                                                                                                                                                                                                                                                                                                                                                 make it a better or more efficient producer of one or more fine chemicals. Mutagenesis of one or more CMRPs may also result in CMRPs having altered activities which indirectly impact the production of one or more desired fine chemicals from plants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            $\times \times \
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a set of peroxidase genes found in plants, especially rice, and their homologues, modified forms and fragments, where the sequences of the peroxidase genes in the set are given in AAH44071 to AAH44091. Also described are: (1) promoters for the control of the gene set; (2) the preparation of cassette vectors using the genes and promoters; (3) analysis of plant characteristics using the peroxidase set by isolating RNA from the plant, binding the RNA to a membrane, mixing with a labelled peroxidase gene set, incubating, and detecting the label signal to show which genes in the set are expressed in the sample plant; and (4) DNA microarrays for peroxidase gene expression analysis. The set of genes are used for the analysis of the pattern of peroxidase gene expression in particular rice plants and their component tissues and under different environmental conditions, and modification of rice plants to provide desired specificities of peroxidase gene expression to impart particular characteristics to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

```
The present sequence represents a chimeric gene, encoding the 5' portion of the GAL4 DNA-binding domain and encoding in the 3' portion the transcriptional activation domain from HSV VP16. The A/T content of the GAL4 nucleotide sequence in this gene is less than 40% (contrasting with 59% in yeast). Reducing the A/T content optimises expression in plants. Constructs containing this nucleic acid can be used to express genes in a known pattern (temporal or spatial) in a plant, and to co-ordinate expression of several genes and, as traps, to isolate plant enhancer sequences. Particular applications are in studies of metabolic pathways and to modulate synthesis of e.g. dyes or lipids. Constructs containing sequences encoding the altered GAL4 DNA binding domain may include a reporter gene linked to a GAL4 responsive upstream activating sequence, particularly one encoding glucuronidase or green fluorescent
                                                                                                                                                                                                                                                                                                             DNA encoding GAL4 DNA binding domain optimised for plant expression - used for expressing genes in known pattern, for co-ordinating expression of several genes and for trapping plant enhancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           misc_feature

                                                                        cancer and other disorders related to angiogenesis including abnormal wound healing, inflammation, rheumatoid arthritis, psoriasis, endometrial bleeding disorders, diabetic retinopathy, some forms of macula degeneration, haemangiomas, and arterial-venous malformations. They may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilisation (chemotaxis) of immune cells. The etiology of these immune deficiencies or disorders may be genetic, somatic, such as cancer or some autoimmune disorders, acquired (e.g. by chemotherapy or toxins), or infectious. They can also be used to treat inflammatory conditions, both chronic and acute conditions. The products can also be used for detection and diagnosis. AAZ32002 to AAZ32080, and AAY49503 to AAY49511 represent sequences given in the exemplification of the present

CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CDNA construct comprising a vector, and at least one nucleic acid
CC fragment comprising a C-terminal heavy chain fragment (Hc) from BoNT
CC serotypes A-G. In preferred embodiments of the invention, the vector is
CC a Venezuelan equine encephalitis virus (VEE) replicon vector. Use of
CC this vector results in the production of large amounts of a protein
CC encoded by a sequence cloned into the replicon. The constructs are used
CC to produce vaccines against botulism. The proteins can also be used as
CC diagnostic tools for the diagnosis of botulism. The transformed host
CC eals can be used to analyse the effectiveness of drugs and agents which
CC inhibit toxin effects. The vaccine currently used against botulism is
CC dangerous and expensive to produce, and contains formalin, which is very
CC painful for the recipient. Also, the vaccine is incomplete, in that only
CC vaccine of overcomes these problems, as it is easily purified, and
CC available in large quantities. It is also expressed in the lymph nodes
CC available in large quantities. It is also expressed in the present
CC synthetic DNA sequences encoding BoNT Hc fragments used in the present
CC invention. These were optimised for codon usage for expression in yeast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BONT) serotypes A, B, C, D, E, F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A-G, is used for inducing an immune response against botulinum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2000-160827/14.

                                                                                                                                                                                                                                                                                                 expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin producing bacterium. Production yield from the genetically engineered products also high and cost of production is lower. The nucleic acids ce be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             12-MAY-1999;

                                                                                                                                                                                                                                                                                                                                        Nucleotide sequences AAZ11972-Z12358 represent open reading frames (ORFs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see AAX18499-Y18944). The antigenic proteins, the fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 199

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                   AAC34305 standard;
                                                                                                                           2236
                                                                                                                                                                                                                                                                                                                                                                                                                                                            transketclase (II) to prepare plants (A) with increased content of tocopherols, Vitamin K, chlorophyll, lignin and/or aromatic amino acids. The method is used to produce transgenic soya, canola, barley, oats, wheat, rape, maize or sunflower with increased contents of tocopherols, Vitamin K, chlorophyll, lignin and/or aromatic amino acids. The plants also have increased resistance to transketclase inhibitors. This sequence encodes the Nicotiana tabacum (tobacco) transketolase protein which is used in the method of the invention.
